Microsoft Edge: Making the web better through more open source collaboration

By [Joe Belfiore](#) / Corporate Vice President, Windows

For the past few years, Microsoft has meaningfully increased participation in the open source software (OSS) community, becoming one of the world's largest supporters of OSS projects. Today we're announcing that we intend to adopt the Chromium open source project in the development of Microsoft Edge on the desktop to create better web compatibility for our customers and less fragmentation of the web for all web developers.

As part of this, we intend to become a significant contributor to the Chromium project, in a way that can make not just Microsoft Edge — but other browsers as well — better on both PCs and other devices.

Making the web better for many audiences

Working with open source is not new for Microsoft Edge. Our mobile browser has been based on open source from its beginnings over a year ago. We've also used open source for various features of Microsoft Edge on the desktop (e.g. Angle, Web Audio, Brotli) and we've begun making contributions to the Chromium project to help move browsing forward on new ARM-based Windows devices.

Our goal is to do this in a way that embraces the well-established open source model that's been working effectively for years: meaningful and positive contributions that align to long-standing, thoughtfully designed architecture, and collaborative engineering. Together we seek the best outcome for all people who use the web across many devices.

Ultimately, we want to make the web experience better for many different audiences. People using Microsoft Edge (and potentially other browsers) will experience improved compatibility with all web sites, while getting the best-possible battery life and hardware integration on all kinds of Windows devices. Web developers will have a less-fragmented web platform to test their sites against, ensuring that there are fewer problems and increased satisfaction for users of their sites; and because we'll continue to provide the Microsoft Edge service-driven understanding of legacy IE-only sites, Corporate IT will have improved compatibility for both old and new web apps in the browser that comes with Windows.

Microsoft Edge + OSS: a new emphasis for Microsoft

Over the next year or so, we'll be making a technology change that happens "under the hood" for Microsoft Edge, gradually over time, and developed in the open so those of you who are interested can follow along. The key aspects of this evolution in direction are:

centralized
analysis administration
content documentation
trackin

Java - Beginner course

Java is a widely used object-oriented programming language and software platform that runs on billions of devices, including notebook computers, mobile devices, gaming consoles, medical devices and many others. The rules and syntax of Java are based on the C and C++ languages.

One major advantage of developing software with Java is its portability. Once you wrote code for a Java program on a notebook computer, it can be easily moved to a mobile device. When the language was invented in 1991 by James Gosling of Sun Microsystems (later acquired by Oracle), the primary goal was to be able to "write once,
